

Clostridium Difficile Infection Rate

C. difficile is one of the many types of bacteria that can be found in feces (bowel movements), and has been a known cause of health care associated diarrhea. *C. difficile* can be picked up on the hands from exposure in the environment and can get into the stomach once the mouth is touched, or if food is handled and then swallowed. Once in the stomach, the bacteria usually will not cause any problems unless the other bowel bacteria are disturbed, which can happen when antibiotics are taken. The use of antibiotics increases the chances of developing *C. difficile* diarrhea as it alters the normal level of good bacteria found in the intestines and colon. Good hand washing by everyone including healthcare staff, physicians, volunteers, patients and visitors is the most effective way to prevent the spread of infectious disease like *C. difficile*.
